

Querido – Quantum AI

Large corporations have exploited every avenue and resource for making AI. They have literally exploited all the data they had access to and was available in the world. They have created models so large that they have trillions of parameters and they have thrown as much hardware as they could have at AI. They have setup datacenters and GPU clusters costing 100's of billions of dollars. They consume energy equivalent to some countries. It seems like there is no way left for AI to go from here.

But there is hope, there is reason to believe that by combining Quantum Computing and AI we can derive exponential advantage. This means exponential breakthroughs in AI. We can make AI models which are gazillions of times more powerful and consume 1000X lesser energy.

The biggest problem is that no one in the world has Quantum AI because while they have the AI part figured out nobody has any quantum computer worth its name.

Querido is powered by a quantum computer specially built for AI which has 1000's of logical qubits. Querido cannot be matched by anyone in the world today.

Querido costs double or triple digit millions of dollars. But if you are serious about Quantum AI let us know.
